SWIGGY INSTAMART-SQL CASESTUDY

This case study focuses on solving real-world business problems for Swiggy Instamart using SQL techniques of various complexities.

✅ **Basic Level Queries**

1. Identify number of customers in each segment
2. List customers in the 'Frequent Shopper' segment
3. Find customers who registered in the last 6 months
4. List products priced between ₹30 and ₹100
5. Find products whose name contains 'Milk'
6. Top 5 oldest delivery partners

✅ **Intermediate Level Queries**

7. Count of delivery partners hired each year
8. Count of orders per month (all years)
9. Most frequently used payment method
10. Count of products available in each category
11. Stores with warehouse capacity less than average
12. Delivery partners with more than 5 deliveries
13. Supplier providing highest revenue-generating products
14. Products with high stock but low sales
15. Cities with high order cancellations
16. Customer segment contributing most to revenue

✅ **Advanced Level Queries**

17. Top 2 most expensive products in each category
18. Rank delivery partners by number of orders handled
19. Categorize products by stock level ('Low', 'Medium', 'High') using CASE
20. Calculate average delivery time per city and rank them
21. Rank customers by total spend
22. Detect customers who placed orders but never received them

---

🎯 **Purpose of Case Study**

- Master practical SQL
- Apply analytical thinking
- Solve business problems effectively
- Generate meaningful insights from data
